Superseded Document		Page 1 of 7
GSOP-104-1-TL-1 v3		

Purpose

This global required tool describes the documentation process for batch information associated with deviations.

Scope

In Scope:

All quality deviations originated within the electronic Global Deviation Database (GDD)

Out of Scope:

Health, Safety, Environmental deviations or Laboratory Investigations

Table of Contents

1.0	Overview	2
2.0	Determine Involvement/ Impact; Add Batches and Batch Bracketing Rationale to Deviation Records	2
3.0	Initial Batch Impact.....	4
4.0	Final Batch Impact	5

GSOP-104-1-TL-1 v3		

1.0 Overview

All deviations are required to be assessed to determine if there is involvement of, or impact to, batches at the time of or as a result of the deviation event. Batches are required to be included within the deviation record with the initial impact documented for each. The initial impact indicates the potential or known impact on the batches. At the conclusion of the investigation, a final conclusion about impact to batch(es) in scope of the deviation must be applied to each batch. The final impact selection of a batch constitutes the recommendation for disposition related to this deviation. Batch release disposition is completed by batch release personnel to consider this final impact recommendation and all other relevant information (including information beyond the deviation in question) to support the batch release decision.

2.0 Determine Involvement/ Impact; Add Batches and Batch Bracketing Rationale to Deviation Records

Step	Activity	Related Information	Responsible
1	Identify Batch Involvement	Select Batch Involved upon Record Creation or Fact Finding. The selection of N/A is only an option for Function/ Non-Manufacturing areas who do not routinely process batches (no batch bracketing rationale is required upon the selection of N/A).	Initiator, Fact Finder
2	Document the Batch Bracketing Rationale	Include all batches identified as involved in, or impacted by, the event within the Batch Bracketing Data Source & Rationale description. A reference to the source data must be included in the deviation batch bracketing rationale. Justify the Batch Bracketing Rationale or why no batch bracketing is required.	Initiator, Fact Finder
3	Add Batches to the Deviation Record during Fact Finding	Add involved and impacted batches to the "Batches" object on the deviation record within three (3) calendar days of record creation. If an additional batch is identified after creation, it must be added and assessed as soon as possible. Rationale for delay in documentation must be included in the appropriate Batch Bracketing Rationale section.	Initiator, Fact Finder
4	Add Batches to the Deviation Record during READY Assessment	Condition: Batches are identified during READY Assessment. When batches are identified for the first time or when additional batches are identified during READY Assessment, complete the verdict indicating "Updates Required" and send it back to Fact Finding. The list of impacted batches cannot be changed during READY Assessment. Rationale for delay in documentation must be included in the appropriate Batch Bracketing Rationale section.	READY Assessor
5	Add Batches Identified During Investigation	Condition: Batches are identified during investigation. If batches are identified for the first time or additional batches are found during an investigation, indicate "Yes" in the Additional Batch(es) Involved field within the Investigation Details and Summary section. Provide information on the new batch, including rationale and source data, in the Additional Batch(es) Involved Rationale field that appears at that time. Document initial batch impact in the Batches section. Collaborate with the READY Assessor to document and lock the initial batch impact for the added batch(es). Conducting this manual assessment is required to enable access to the Final Impact field. Refer to global procedure GSOP-104-3, Investigation .	Investigator, READY Assessor

2.0 Determine Involvement/ Impact; Add Batches and Batch Bracketing Rationale to Deviation Records

Step	Activity	Related Information	Responsible
6	Remove a Batch from the Record at Fact Finding	Condition: A batch was added in error. Batches added in error may be deleted during Fact Finding. Batches that move past READY Assessment automatically become locked by the system and cannot be removed.	Initiator, Fact Finder
7	Remove a Batch from the Record During Investigation	Condition: A batch was added in error. Batches added in error at Investigation can be removed up until the point where the batch is assessed and locked by the READY Assessor. Batches added in error that cannot be removed must have the final batch impact assessed as described in Section 5.0, Final Batch Impact, Out of Scope.	READY Assessor, Investigator
8	Use of Placeholder Batch for Contract Manufacturing Organizations (CMO)	Condition: The Lilly batch is not known (you only have the external partner's batch reference) or the batch is not a Lilly batch (for example, intermediate component batch that needs to be assembled into a sub assembly that will be delivered to Lilly afterwards). The Fact Finding and READY Assessment steps need to be completed. Select the following batch to have at least one item in the batch section to be able to complete Fact Finding and READY Assessment: - CMO – Lilly Batch Pending when the product is a Lilly one, but you don't have yet the Lilly batch number. If the Lilly batch number is known, you must add it and not use this placeholder batch. - CMO – No Lilly Batch when the batch impacted is an intermediate product that is not supplied directly to Lilly (and thus will never have a Lilly batch number) or if the batch number is unavailable before deviation approval.	Initiator, Fact Finder
9	Removal of Placeholder Batch	Condition: the CMO – Lilly Batch Pending has been used and the Lilly batch is known before the deviation due date Placeholder batch needs to be removed and replaced by the real batch reference in the deviation before routing it in review/approval. Once the Lilly batch is known, replace the placeholder with the Lilly SAP batch number. Condition: the CMO – Lilly Batch Pending option is selected and the Lilly batch is not available by the deviation due date The placeholder batch should be removed and substituted with CMO - No Lilly Batch before proceeding to review/approval. Note: The removal can be performed at Fact Finding or In Investigation but not at READY Assessment. The removal of these placeholder batches during investigation is specific to these objects. No other batch (=Lilly SAP batch or CMO - No Lilly Batch) can be removed when the deviation is in investigation.	Initiator, Fact Finder, Investigator

3.0 Initial Batch Impact

Step	Activity	Related Information		Responsible
1	Add the Initial Impact to Batch(es)	Add the initial impact to each batch added to the deviation record and select the initial batch impact. Note: Although SAP and the GDD are interfaced, assigning an initial batch impact status to a batch in the GDD will not alter its status in SAP. Instead, it sends a notification flag indicating that a deviation is impacting the batch. Any status updates in SAP must be performed manually.		Initiator, Fact Finder, READY Assessor, Investigator
		Initial Impact Status	Description	
		Hold	Batch is involved or potentially impacted but the batch does not need re-inspection (for example, batch is released at the time of deviation discovery and within the control of Lilly/ Contract Manufacturer/ Distributor).	
		Quarantine	Batch is impacted or potentially impacted, has the potential to be rejected, and shall be quarantined and not released/ distributed without inspection/ re-inspection (for example, batch needs to be controlled to prevent forward processing and is placed in blocked status in inventory control system pending deviation investigation and resolution).	
		Reject to Scrap	Batch is impacted or potentially impacted where rejection is confirmed and shall not be released/ distributed.	
		Forward Processing Prior to Release	Batch is impacted or potentially impacted; however, may be forward processed but shall not be released/ distributed pending deviation approval and determination of next steps.	
		Radiopharma Release (short shelf life)	This selection must only be used for Radiopharma batches. Batch has been impacted or potentially impacted and is acceptable for release based on preliminary investigation and assessment along with the short shelf life of the product.	
2	Radiopharma Release Selection for Initial Batch Impact	Condition: Radiopharma Release selected for initial batch impact. Create a User Task for the Batch Release QA Manager or Qualified Person to document that a batch may be released prior to deviation closure. Once the assessment is completed, the final batch impact must be locked in the system by personnel with product oversight responsibilities.		Initiator, Fact Finder, READY Assessor
3	Bulk Batch Disposition	Condition: All batches require the same initial batch impact. Select Bulk Batch Disposition when all added batches require the initial batch impact to be updated with the same selection. Note: Batches where the initial impact was already selected will not be updated using this option. If an update needs to be made, it must be done manually.		READY Assessor

3.0 Initial Batch Impact

Step	Activity	Related Information	Responsible
4	Complete the Assessment	Once the initial batch impact is determined, the state is automatically changed to assessed when the record progresses past READY Assessment. The assessment must be manually completed for batches added at Investigation. The initial impact decision is locked once the record progresses past READY Assessment or once the initial batch assessment workflow is complete.	READY Assessor
5	Create a Risk Assessment for Released Product	Condition: Involved/ impacted batches have been released. Risk assessments are used to evaluate the need for regulatory reporting when involved/ impacted batches have been released, including those released to other Lilly sites. Create a User Task for the Risk Assessor (for example, TS/MS) to complete the assessment. The assessment must be conducted immediately (recommended within 24 hours from the date the situation is discovered). Refer to global required tool GSOP-104-1-TL-6, Product Risk Assessment.	READY Assessor

4.0 Final Batch Impact

Step	Activity	Related Information		Responsible
1	Apply Final Batch Impact	Add the final batch impact to each batch in the deviation record prior to concluding the investigation. Select the final impact for each individual batch or Final Bulk Disposition to apply an impact to all batches. Batches where a final impact was selected prior to using the bulk disposition option must be updated manually, if needed.		Lead Investigator, READY Assessor
		Final Impact Status	Description	
		Rework/ Reprocess	Batch has been confirmed to have been impacted and requires rework/ reprocessing/ reidentification and shall not be released/ distributed.	
		Reject to Scrap	Batch has been confirmed to have been impacted and requires: • Full rejection and shall not be released/ distributed or, • Partial rejection and a portion of the batch needs to be rejected. The rest of the batch shall be released/ distributed. Details on the impacted portion and rationale must be included in the Investigation Details.	
		Reject to Return to Vendor	Batch has been confirmed to have been impacted and requires rejection to be returned to Vendor.	
		Approve	Batches that have been confirmed to meet market release/ Clinical Trial release/ distribution requirements and shall be released/ distributed.

4.0 Final Batch Impact

Step	Activity	Related Information		Responsible
		Approved (Limited)	Batch that has been limited to a specific country or regional requirements, specific production formulation, or for reservation of the batch for a specific business activity (for example, validation, non-GMP development use); includes release under concession if the justification is provided. If Approved (Limited) is selected as the final batch impact, rationale must be included in the Investigation Details.	
		Out of Scope	Batch has been confirmed to have not been involved in the impact of the deviation and shall be released/ distributed.	
		CMO Disposition Confirmed	A CMO recommended Batch disposition has been agreed to by Lilly. The final batch impact is documented in the deviation record.	
		Condition: Deviations with batch impact Only personnel with product oversight responsibilities are permitted to confirm the final batch impact. The final batch impact confirmation occurs at the approval of the record. Condition: Out of Scope batch If the batch has been determined to be Out of Scope, create a User Task (Type: Batch Impact Assessment) to document the assessment. The User Task is assigned to the READY Assessor. The Quality Assurance M3 or Product Quality Leader/ IBUQA P4 will confirm their alignment (via the Confirmer team assignment) with the assessment of the batch to be Out of Scope, to allow for product to be released/ distributed prior to approval of the deviation. Once the assessment is completed, the final batch impact must be locked in the system by personnel with product oversight responsibilities.		
2	Deviation Approval and Batch Impact	Approval of the deviation will serve as the confirmation of the selected final batch impact status. The approval must include an approver with product quality oversight.		Approver(s)

Revision History

The Revision History will only include the current version of the document changes.

See previous document versions in the document management system (DMS) for historical changes.

Version Number	Effective Date	List of Major Changes
4	Effective date viewable in eDMS.	In section 1.0, clarified that the final batch impact is a recommendation based on the individual deviation and that batch release personnel is responsible for the final batch release decision. In section 2.0, step 5, clarified activities, roles and responsibilities of the lead investigator and the ready assessor when batches are added in investigation. In section 2.0, steps 6 and 7, clarified when batches can no longer be removed from the deviation. In section 2.0, step 8, added note to clarify the use of a placeholder batch when the SAP batch is not available before deviation approval. In section 3.0, removed the requirement to create a task in the system for forward processing batches between Lilly sites impacted by a deviation. In Section 4.0. step 1, the scope of the "Rework/Reprocess" final impact now includes batches that require reidentification. In section 4.0. step 1, specified that you need a justification for batches released under concession in "Approved (Limited)" final impact. In section 4.0, step 1, clarified user task activities related to the condition of Out of Scope batches.
