

GSOP-1405.1-TL.1 v2.0

Change Pre-Planning

PURPOSE

This required tool describes the process to determine if a planned modification requires a change control and in which system(s) the change control is to be captured. Certain modifications to systems or processes may not require initiation of change control through the electronic Quality Management System (eQMS) or within the Global Service Management Tool.

SCOPE

This required tool applies to modifications, within Lilly's authority or control to manage and execute, to:

- GxP or HSE-regulated processes, equipment, facilities, or data
- GxP or HSE-regulated computer systems and infrastructure
- Originating from Supplier Change Notifications (refer to [GSOP-1301.1-TL.11 Supplier Change Notification](#))

APPENDIX A: EXAMPLES OF MODIFICATIONS AND ASSOCIATED MANAGEMENT	5

INSTRUCTIONS

1.0 General Overview

The pre-planning process is the foundation of effective change control across GxP/HSE processes and regulated computer systems. It ensures that proposed modifications are appropriately evaluated before initiation, confirming that they meet the change control criteria and are managed in the appropriate system based on their nature and regulatory significance.

GSOP-1405.1-TL.1 v2.0

Change Pre-Planning

2.0 Determine if Change Control is Needed

Responsible role for this section: Change Owner

Perform an initial evaluation on all proposed modifications, to determine whether a Change Control is required. This determination is performed during the Change Pre-Planning phase by the Change Owner or designated responsible function (for example, Quality, HSE, Tech@Lilly), as needed.

Refer to **Figure 1 Change Control Determination** to determine if a modification requires a Change Control.

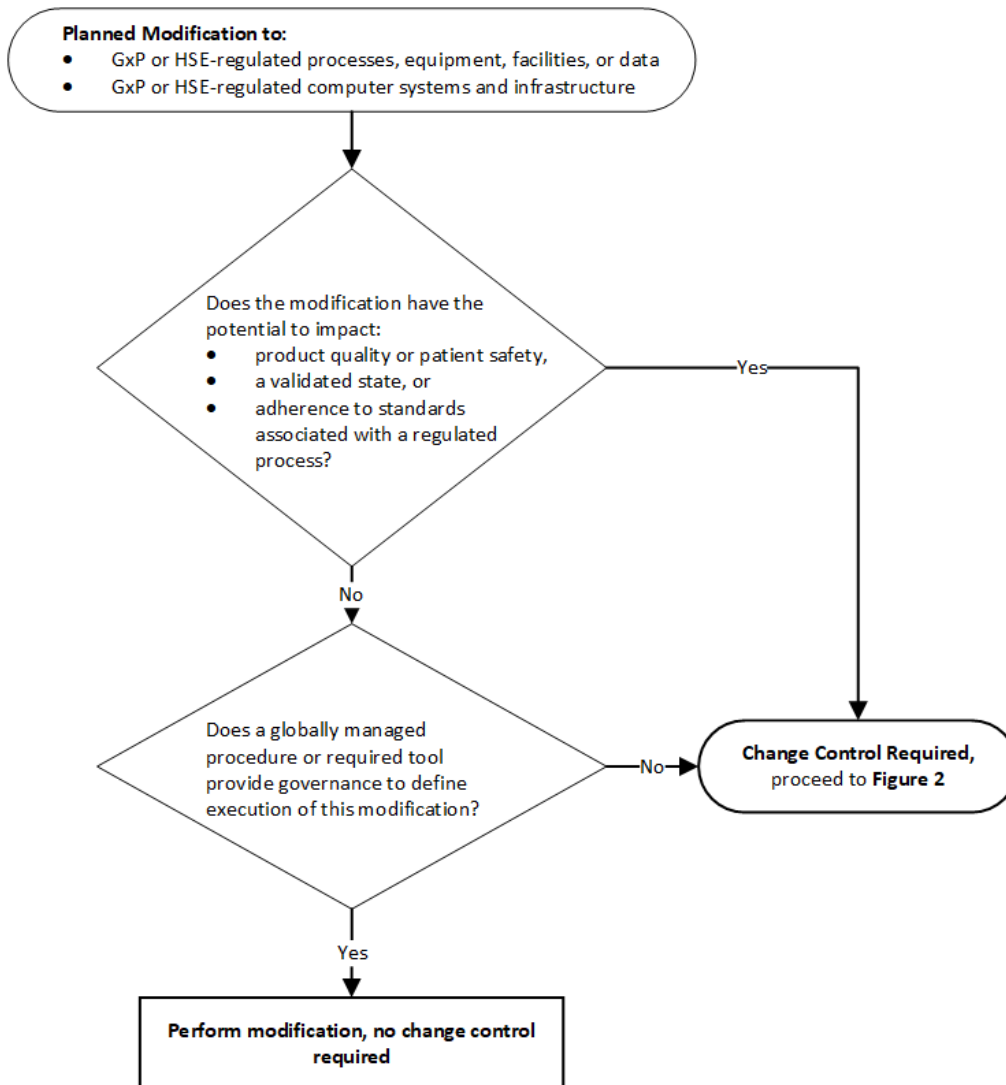

Figure 1: Change Control Determination

GSOP-1405.1-TL.1 v2.0

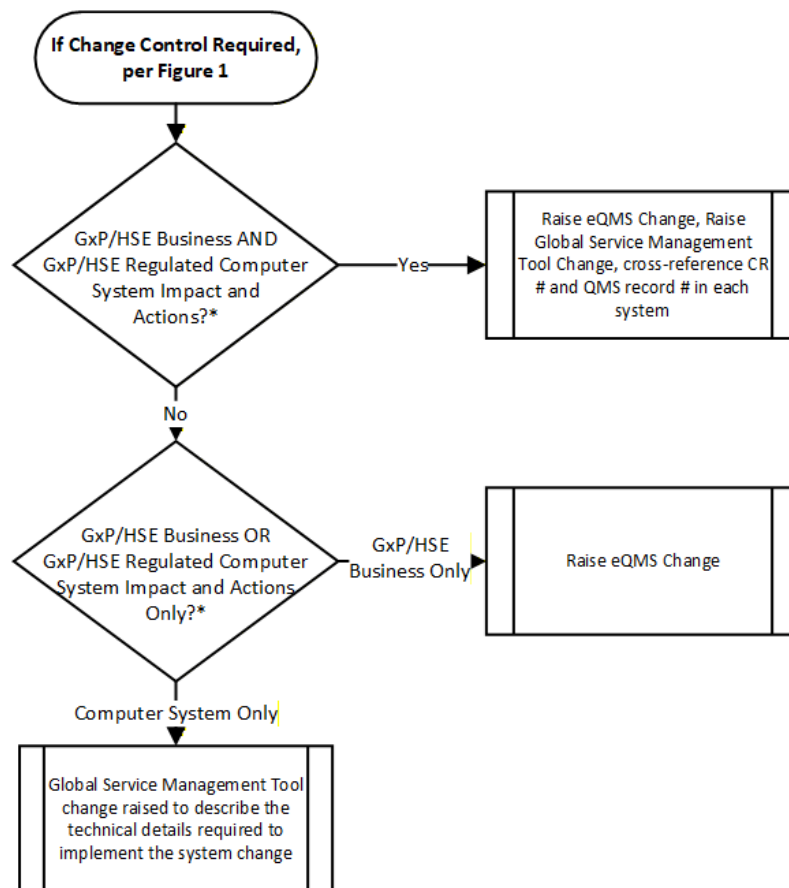

Change Pre-Planning

3.0 Determine Appropriate Change Control System

Responsible role for this section: Change Owner

Once it has been established that a modification requires Change Control as per **Figure 1 Change Control Determination**, the next step is to determine which system should be used to manage and document the change: eQMS or the Global Service Management Tool. The determination is based on the nature, ownership, and execution of actions of the proposed change.

Refer to **Figure 2 Change Control System Determination** to best determine the appropriate system in which to manage the Change Control.

NOTE: *Only create a change record if at least one change action will occur in the GxP/HSE Business or Regulated Computer System domain. Avoid creating records that merely reference another change record.

Figure 2: Change Control System Determination

GSOP-1405.1-TL.1 v2.0

Change Pre-Planning

Owners of change controls within each system are jointly responsible for ensuring alignment, maintaining traceability, and eliminating redundancy between these related records. The linkage must be documented in both systems to ensure complete traceability. When managing a change across dual systems, examples of implementation steps that may reside within each change system:

eQMS	Global Service Management Tool
• Technical document updates • Impact/Risk assessments and actions for full scale of change (for example, across multiple systems, enterprise applications) • Changes to the required information or workflows for GxP processes facilitated by a computer system	• System changes required to be performed by a system admin • Code changes • Upgrade to system software and associated documentation • Periodic Patches • Data Changes

Refer to **Appendix A Examples of Modifications and Associated Management** for additional assistance.

TERMS & DEFINITIONS

The following are terms and definitions used within this document.

Term	Definition
N/A	N/A

REFERENCED DOCUMENTS

Document Number	Description

REVISION HISTORY

List of Changes
Version 2: Administrative change. Updated document number for Supplier Change Notification.

GSOP-1405.1-TL.1 v2.0

Change Pre-Planning

APPENDIX A: EXAMPLES OF MODIFICATIONS AND ASSOCIATED MANAGEMENT

The table below documents examples of common modifications, their appropriate management pathway, and consideration that should be taken during pre-planning. This table is not exhaustive and is not intended to replace or be used in lieu of outcomes or decisions taken in accordance with **Figure 1 Change Control Determination** and **Figure 2 Change Control System Determination**.

Modification Type	Appropriate Management Pathway	Additional Considerations
Modifications affecting business process and validated state of computerized systems (for example, updates to MES, LIMS)	Dual System Change Control (eQMS + Global Service Management Tool) in accordance with the respective procedures listed below.	Consider the usage of dual system change control, even if Global Service Management Tool Change Control is performed via a pre-approved change.
Modifications to: - validated state of internal or third-party facilities, utilities, or physical equipment (for example, assets managed within GMARs, environmentally controlled spaces) - manufactured or distributed product, inclusive of new product introduction or deletion	eQMS Change Control, managed in accordance with GSOP-1405.1 Change Control	N/A
Modifications to: - IT infrastructure, impacting a validated or GxP-relevant system - Data, requiring system admin execution	Global Service Management Tool Change Control, managed in accordance with LCS-501, Lilly IT Change Management using ServiceNow	If change is to Master Data (governing, non-transactional data or selection values) for a GxP system, consider if in addition, an associated change control in eQMS is required to manage mitigating actions (that is, dual system change control). If no eQMS change is necessary, business actions required prior to deployment must be documented in the Global Service Management Tool.
Modifications inclusive of new procedures or procedural updates that do not affect the validated state	Managed in accordance with GSOP-1501.3 Quality System Architecture Document Lifecycle Management	If this is a part of, or related to, a larger-scale change control, the change control should track the completion of this process as a change action / step within the change control.

**GSOP-1405.1-TL.1 v2.0**
Change Pre-Planning

Modification Type	Appropriate Management Pathway	Additional Considerations
Modifications as part of routine maintenance (for example, equipment cleaning, filter change, HVAC inspection)	Managed in accordance with GQS215 Maintenance	N/A
